Chapter 1

Introduction

This package, `SL2Reps`, provides methods for constructing and testing matrix presentations of the representations of $SL_2(\mathbb{Z})$.

Irreducible representations of prime-power level are constructed individually by means of Weyl representations, and from these a list of all representations of a given degree or level may be produced. The format is designed to be useful in the study of modular tensor categories in particular.

1.1 Installation

To install `SL2Reps`, first download it from `TODD`, then place it in the `pkg` subdirectory of your GAP installation (or in the `pkg` subdirectory of any other GAP root directory, for example one added with the `-l` argument).

`SL2Reps` is then loaded with the GAP command

```
gap> LoadPackage( "SL2Reps" );
```

1.2 Usage

Individual representations may be constructed via the methods in [5](#), while lists of representations with given degrees or levels may be constructed with those in [3](#).

This package uses an `InfoClass`, `InfoSL2Reps`. It may be set to 0 (silent), 1 (info), or 2 (verbose). To change it, use

```
gap> SetInfoLevel(InfoSL2Reps, k);
```

Chapter 2

Description

The group $\mathrm{SL}_2(\mathbb{Z})$ is generated by $\mathfrak{s} = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$ and $\mathfrak{t} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$, subject to the relations $\mathfrak{s}^4 = \mathrm{id}$, $(\mathfrak{st})^3 = \mathfrak{s}^2$. Thus, any complex representation $\rho : \mathrm{SL}_2(\mathbb{Z}) \rightarrow \mathbb{C}^n$ (where $n \in \mathbb{Z}^+$ is called the *degree* of ρ) is defined by the $n \times n$ matrices $S = \rho(\mathfrak{s})$ and $T = \rho(\mathfrak{t})$. In fact, any such representation factors through $\mathrm{SL}_2(\mathbb{Z}/\ell\mathbb{Z})$ for some $\ell \in \mathbb{Z}^+$; the smallest such ℓ is called the *level* of ρ . We therefore present representations in the form of a record

```
rec(S, T, degree, level, name)
```

where the name follows the conventions of [NW76]. Note that our definition of \mathfrak{s} follows that of [Nob76]; other authors prefer the inverse, i.e. $\begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}$. When working with that convention, one must invert the S matrices output by this package.

2.1 Construction

For any representation ρ of $\mathrm{SL}_2(\mathbb{Z})$, we may decompose ρ as a direct sum of irreducible representations of prime-power level using the Chinese remainder theorem. Therefore, to characterize all representations of $\mathrm{SL}_2(\mathbb{Z})$, it suffices to consider irreducible representations of $\mathrm{SL}_2(\mathbb{Z}/p^\lambda\mathbb{Z})$.

Such representations may be constructed using Weyl representations as described in [Nob76, Section 1]. The Weyl representations used by this package have the following form. Let p be a prime number and $\lambda \in \mathbb{Z}^+$. Choose a $\mathbb{Z}/p^\lambda\mathbb{Z}$ -module M of rank 1 or 2, and a quadratic form Q on M , such that (M, Q) is of one of the three types described in 2.2. The *quadratic module* (M, Q) then gives rise to a representation of $\mathrm{SL}_2(\mathbb{Z}/p^\lambda\mathbb{Z})$, denoted $W(M, Q)$.

With a finite number of exceptions, every representation of $\mathrm{SL}_2(\mathbb{Z}/p^\lambda\mathbb{Z})$ may be found as a subrepresentation of $W(M, Q)$ for an appropriate choice of (M, Q) [NW76, Hauptsatz 2]. The 18 exceptions may be found as the tensor product of two such subrepresentations; these may be generated with `SL2Reps_Exceptions` (3.3.1).

Representations of $\mathrm{SL}_2(\mathbb{Z})$ may then be found as direct sums of these prime-power representations.

2.2 Weyl representation types

2.2.1 Type D

Let p be prime and $\lambda \geq 1$. Then the Weyl representation arising from the quadratic module with $M = \mathbb{Z}/p^\lambda\mathbb{Z} \oplus \mathbb{Z}/p^\lambda\mathbb{Z}$ and $Q(x, y) = \frac{xy}{p^\lambda}$ is said to be of type D and denoted $D(p, \lambda)$. Information on

(M, Q) may be obtained via `SL2Reps_ModuleD` (5.1.1), and subrepresentations of $D(p, \lambda)$ with level p^λ may be constructed via `SL2Reps_RepD` (5.1.2).

2.2.2 Type N

Let p be prime and $\lambda \geq 1$. Then the Weyl representation arising from the quadratic module with $M = \mathbb{Z}/p^\lambda \mathbb{Z} \oplus \mathbb{Z}/p^\lambda \mathbb{Z}$ and $Q(x, y) = \frac{x^2 + xy + \frac{1+u}{4}y^2}{p^\lambda}$ (where, for $p \neq 2$, u is chosen so that $u \equiv 3 \pmod{4}$ with $\left(\frac{-u}{p}\right) = -1$, and for $p = 2$, $u = 3$) is said to be of type N and denoted $N(p, \lambda)$. Information on (M, Q) may be obtained via `SL2Reps_ModuleN` (5.2.1), and subrepresentations of $D(p, \lambda)$ with level p^λ may be constructed via `SL2Reps_RepN` (5.2.2).

2.2.3 Type R

The construction of type R varies depending on whether $p = 2$.

First, if p is an odd prime, let $\lambda \geq 2$, $\sigma \in \{1, \dots, \lambda\}$, and $r, t \in \{1, u\}$ with u a quadratic non-residue mod p . Then define $M = \mathbb{Z}/p^\lambda \mathbb{Z} \oplus \mathbb{Z}/p^{\lambda-\sigma} \mathbb{Z}$ and $Q(x, y) = \frac{r(x^2 + p^\sigma t y^2)}{p^\lambda}$.

On the other hand, if $p = 2$, let $\lambda \geq 2$, $\sigma \in \{0, \dots, \lambda - 2\}$ and $r, t \in \{1, 3, 5, 7\}$. Then define $M = \mathbb{Z}/2^{\lambda-1} \mathbb{Z} \oplus \mathbb{Z}/2^{\lambda-\sigma-1} \mathbb{Z}$ and $Q(x, y) = \frac{r(x^2 + 2^\sigma t y^2)}{2^\lambda}$.

In either case, the resulting representation is said to be of type R and denoted $R(p, \lambda, \sigma, r, t)$. Information on (M, Q) may be obtained via `SL2Reps_ModuleR` (5.3.1), and subrepresentations of $R(p, \lambda, \sigma, r, t)$ with level p^λ may be constructed via `SL2Reps_RepR` (5.3.2). Note that if $\sigma = \lambda$ for $p \neq 2$, then the second factor of M is trivial (and hence t is irrelevant); this special case is handled by `SL2Reps_RepRUnary` (5.3.3).

Chapter 3

Lists of representations

3.1 Lists by degree

3.1.1 SL2Reps_PrimePowerIrrepsOfDegree

▷ SL2Reps_PrimePowerIrrepsOfDegree(*degree*) (function)

Returns: a list of records of the form `rec(S, T, degree, level, name)`

Constructs a list of all irreps of $SL_2(\mathbb{Z})$ that are exactly the given degree and have prime power level.

3.1.2 SL2Reps_PrimePowerIrrepsOfDegreeAtMost

▷ SL2Reps_PrimePowerIrrepsOfDegreeAtMost(*max_degree*) (function)

Returns: a list of records of the form `rec(S, T, degree, level, name)`

Constructs a list of all irreps of $SL_2(\mathbb{Z})$ that are at most the given degree and have prime power level.

3.1.3 SL2Reps_IrrepsOfDegree

▷ SL2Reps_IrrepsOfDegree(*degree*) (function)

Returns: a list of records of the form `rec(S, T, degree, level, name)`

Constructs a list of all irreps of $SL_2(\mathbb{Z})$ that are exactly the given degree.

3.1.4 SL2Reps_IrrepsOfDegreeAtMost

▷ SL2Reps_IrrepsOfDegreeAtMost(*degree*) (function)

Returns: a list of records of the form `rec(S, T, degree, level, name)`

Constructs a list of all irreps of $SL_2(\mathbb{Z})$ that are at most the given degree.

3.2 Lists by level

3.2.1 SL2Reps_PrimePowerIrrepsOfLevel

▷ SL2Reps_PrimePowerIrrepsOfLevel(*p*, *lambda*) (function)

Returns: a list of records of the form `rec(S, T, degree, level, name)`

Constructs a list of all irreps of $SL_2(\mathbb{Z})$ with level exactly p^λ .

3.3 Lists of exceptional representations

3.3.1 SL2Reps_Exceptions

▷ `SL2Reps_Exceptions(arg)`

(function)

Returns: a list of records of the form `rec(S, T, degree, level, name)`

Constructs a list of the 18 exceptional irreps of $\mathrm{SL}_2(\mathbb{Z})$.

Chapter 4

Methods for testing

4.1 Testing

4.1.1 SL2Reps_SL2Conj

▷ `SL2Reps_SL2Conj(p , ld)` (function)

Returns: the group $SL_2(\mathbb{Z}/p^\lambda\mathbb{Z})$ with conjugacy classes set to the format we use.

4.1.2 SL2Reps_ChiST

▷ `SL2Reps_ChiST(S , T , p , ld)` (function)

Returns: a list representing a character of $SL_2(\mathbb{Z}/p^\lambda\mathbb{Z})$

Converts the modular data (S, T) , which must have level dividing p^λ , into a character of $SL_2(\mathbb{Z}/p^\lambda\mathbb{Z})$, presented in a form matching the conjugacy classes used in `SL2Reps_SL2Conj`.

4.1.3 SL2Reps_IrrepPositionTest

▷ `SL2Reps_IrrepPositionTest(p , $lambda$)` (function)

Returns: a boolean

Constructs and tests all irreps of level dividing p^λ by checking their positions in $\text{Irr}(G)$.

Chapter 5

Irreducible representations of prime-power level

5.1 Representations of type D

See [2.2.1](#).

5.1.1 SL2Reps_ModuleD

- ▷ `SL2Reps_ModuleD(p , ld)` (function)
Returns: a record describing (M, Q)
Constructs information about the underlying quadratic module (M, Q) of type D .

5.1.2 SL2Reps_RepD

- ▷ `SL2Reps_RepD(p , ld , chi_index)` (function)
Returns: a list of lists of the form $[S, T]$
Constructs the irreducible representation(s) of type D with level p^λ corresponding to the character χ indexed by chi_index .

5.2 Representations of type N

See [2.2.2](#).

5.2.1 SL2Reps_ModuleN

- ▷ `SL2Reps_ModuleN(p , ld)` (function)
Returns: a record describing (M, Q)
Constructs information about the underlying quadratic module (M, Q) of type N .

5.2.2 SL2Reps_RepN

- ▷ `SL2Reps_RepN(p , ld , chi_index)` (function)
Returns: a list of lists of the form $[S, T]$

Constructs the irreducible representation(s) of type N with level p^λ corresponding to the character χ indexed by `chi_index`.

5.3 Representations of type R

See 2.2.3.

5.3.1 SL2Reps_ModuleR

- ▷ `SL2Reps_ModuleR(p, ld, sigma, r, t)` (function)
Returns: a record describing (M, Q)
Constructs information about the underlying quadratic module (M, Q) of type R .

5.3.2 SL2Reps_RepR

- ▷ `SL2Reps_RepR(p, ld, sigma, r, t, chi_index)` (function)
Returns: a list of lists of the form $[S, T]$
Constructs the irreducible representation(s) of type R with level p^λ corresponding to the character χ indexed by `chi_index`.

5.3.3 SL2Reps_RepRUnary

- ▷ `SL2Reps_RepRUnary(p, ld, r)` (function)
Returns: a list of lists of the form $[S, T]$
Constructs the irreducible representation(s) of unary type R (that is, with $\sigma = \lambda$) with level p^λ .
